# PROTINUS®

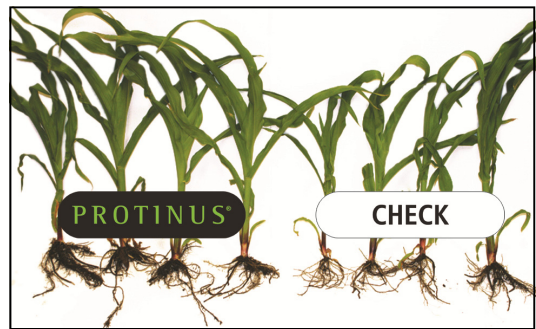

SEED NUTRITION

## An innovative, seed-applied fertilizer that promotes early plant growth

PROTINUS seed-applied fertilizer improves seedling growth by providing plants small amounts of important nutrients right after germination – before the plant can easily access soil nutrients on its own. By improving early plant growth, growers see the benefit in crop establishment, early-season growth and the ability to withstand challenging growing conditions.

### What **corn** growers gain from improved early-season growth with PROTINUS:

- Seedlings emerge faster and more evenly
- Larger seedlings with longer, more developed root systems are better able to compete with weeds for moisture and nutrients
- Young seedlings can better withstand tough early-season growing conditions, such as cool spring temperatures
- A healthy crop means better yields, and a healthy return on your seed investment.

PROTINUS-treated corn (on the right) resulted in larger seedlings with longer, more developed roots systems compared the control (left).

Impact of PROTINUS	Proven PROTINUS Performance*	Benefits to your Corn Crop
Faster, more even emergence	Seedlings emerge 1-2 days faster with 20-30% more plants	More plants up and out of the ground sets the stage for a successful crop
Larger, more vigorous seedlings	10 – 20% larger plants	Larger seedlings are better able to compete with weeds and withstand early-season stress
Bigger, more developed roots	30% larger, more developed roots	Your corn crop can better access nutrients and moisture

\*Based on Wolf Trax and 3<sup>rd</sup> party evaluations 2008 - 2010
